

Transformers

With our own manufacturing premises in Eastern Europe, and suppliers from around the world, PW transformers meet all international standards and provide very cost effective solutions to users' supply requirements.

ISO robot gun transformers.

Originally designed for use in automated weld guns, these powerful units have established themselves in the manual weld gun and automated equipment markets. Available in supply voltages from 220 to 550 and kVA ratings from 32kVA to 103kVA (individual data sheets available on request)

Medium Frequency

MF welding is fast establishing itself as the industry standard in car factories worldwide. The benefits of better spot quality, lower mains demand, longer tip life and lack of current reduction when used with large guns, are being recognised in all industries.

Available in sizes up to 400kVA

Package transformers

Either single secondary (shown here) or twin secondary, these units have formed the basis of much industrial production for the last two decades. Now available in ISO sizes, they can be used in standard machines or in automated applications. Available from 40kVA upwards

Portable gun transformers (ISO)

Many factories worldwide still use overhead transformers. The ISO range, shown here, are effective replacements for the older style laminated units.

Available from 75kVA up to 250kVA

Portable gun transformers

Packaged ready for use, these are supplied with the steel mounting frame and a built in tap switch for range selection. Available from 75kVA up to 250kVA
