

Suspension Systems

Track Systems & Jib Cranes

The hanging of portable weld guns is crucial to their efficient use.

An operator will be working with his gun for up to 8 hours and must be able to maintain productivity throughout that period.

PW has years of experience in all aspects of portable gun specification, installation and commissioning and can design and recommend complete factory suspension systems.

It is important that the inertia of the track system is minimised, so that all the gun operator's effort is applied to moving the gun around the workpiece and not to moving the track.

All systems supplied by PW meet this need, with the track itself requiring a force of only around 2% of the suspended load to make it move.

PW use our experience to ensure that the track is at the right height, that the jib crane is the right height and radius for the floor area to be covered, that the correct spring balancer is used and that all systems meet current stringent Health & Safety legislation.
